ARE POPPERS LEGAL?

Yes, it’s legal to possess and use poppers. However, supplying or giving poppers to someone under the age of 18 is not advisable, and may be illegal.

Whether or not it’s legal to sell them is tricky. Under 2005 General Product Safety Regulations, it’s a requirement to sell products with instructions for safe use ... which is clearly not the case for poppers. So although prosecutions are rare, strictly speaking, a retailer could be breaking the law.

HELP AND INFORMATION

Text or WhatsApp Re-Solv on 07496 959930 or phone in confidence on 01785 810762 from 10am-4pm, Mon-Fri. There's more online at re-solv.org.

There’s information on pretty much any drug at talktofrank.com, plus a confidential phone helpline on 0300 123 6600, text 82111 and a live chat service.

There’s practical advice on poppers and other drugs at drugsience.org.uk, drugwise.org.uk, wearetheloo.org, lgbt.foundation and, for U25s, at the mix.org.uk.

ARE POPPERS DANGEROUS?

For healthy people, the risks of using poppers are relatively low in comparison with other volatile substances and other drugs.

However, the latest government data shows that between 2010-2016 there were 12 deaths in England and Wales involving poppers.

HARM REDUCTION

NEVER SWALLOW POPPERS – they’re toxic and can kill.

THEY’RE HIGHLY FLAMMABLE so keep them away from flames or lit cigarettes – you could get badly burned.

POPPERS CAN CAUSE CHEMICAL BURNS if they come into contact with eyes or skin. If this happens, rinse with plenty of water and get medical advice.

DON’T MIX WITH OTHER DRUGS as the effects can be unpredictable – and even fatal when combined with drugs that affect blood pressure (e.g. Viagra).

If you’re using poppers for sex, ALWAYS WEAR A CONDOM.

HEALTH RISKS

Because poppers lower blood pressure and increase heart rate they are more risky for people with heart conditions, abnormal blood pressure, anaemia or glaucoma and for those who are pregnant.

HEADACHES: The most common after-effect of using poppers is headache and nausea.

EYE DAMAGE: Isopropyl nitrite is being linked with a form of eye-damage, known as ‘Poppers Maculopathy’. If you have any worries about your sight, please talk to your GP or optician.

BLOOD-BORNE VIRUSES: Poppers may increase the chance of tearing during sex which makes it easier for HIV or Hep C to enter the bloodstream.

CANCER: All nitrites are potential carcinogens and isobutyl nitrite is a known carcinogen. Long-term, regular use of poppers may be linked with an increased risk of certain kinds of cancer.

POPPERS AND OTHER DRUGS: Mixing drugs is always going to add risk. Also, when used with poppers, any drug that affects blood pressure (including erection-inducing drugs) can cause fainting, stroke or a potentially fatal heart attack.

OVERDOSE is uncommon but can cause organ failure due to ‘methemoglobinemia’ - where the blood is unable to carry oxygen around the body leading to organ failure and even death.
